

## EBNP

### PICO Scenario #2

You are working on a radiation oncology team and would like to standardize skin. The doctors and residents automatically prescribe flamazine cream once a bit of redness occurs (dermatitis). However, you think you remember seeing studies that have demonstrated reduced dermatitis if used prior to radiation, or from the beginning of radiation. You would like to know if flamazine cream is the best medication, and when during treatment it should be used.
